ABSTRACT

The location of and the component parts for each BAT weapon system manufactured by Firestone are presented. Illustrations of the T137E3 rifle, the T152E5 mount and the new fire control mechanism are shown. A charge development program was conducted to establish the pressure which would be developed in the T137E3 rifle with the regular M323 type charge. The test data are given and discussed. Data comparing piezo and copper pressure measurements are presented. The use of M32 cartridge cases in the T137E3 rifle is described. A future program is given.

Two accuracy tests of the Tl38E57 projectile at 2000-yard range are described and the firing data are presented. All firings with this projectile at this longer range are summarized. A future program is given.

Accuracy tests of the Tll9 projectile, at ranges of 1000 and 2000 yards are described. One of these programs was fired from a smooth bore tube and the other from a rifled tube. The results of charge development tests are discussed. An advance program is presented.

Penetration tests were conducted to investigate further the effect of internal tee configuration upon penetration. The test data are given. A future program for penetration studies is outlined.

Several aspects of projectile fuzing were investigated. These involved the superquick-delay mechanical fuze, the nose element crystal assemblies and the DRD328 base element. The tests are discussed. A future program is presented.

THE WEAPON SYSTEM

A distribution report is given in Table I showing the locations and the component

parts of the BAT weapon systems manufactured by Firestone.

T137E1 - 85 in, tube, Firestone breech mechanism

T137E2 - 95 in. tube, modified M27 breech mechanism

T137E3 - 105 in, tube, M27 breech mechanism; modified to fire T170 ammunition & T119 and T138

T152E2 - Elevating mechanism forward of trunnions, taper leg locks, center fire control buttons

T152E3 - Similar to E2 except for use of roller hearings and guide rails on elevating system

T152E4 - Ratchet-type leg locks, safety lock on firing mech.; squeeze type triggers, free traverse lever

T152E5 - Identical to E4 except new tripod designed to attach to body flange M38 or M38A1

The T137E3 rifle, shown in Fig. 1, was designed to chamber M323 and M325 ammunition as well as T119 and T138 ammunition. Table I shows that a T137E3 rifle is a component of two systems now at Aberdeen Proving Ground, one with a T152E4 mount and one with a T152E5 mount.

The T152E5 mount, shown in Fig. 2, includes all of the revisions of the T152 E4 mount plus a new tripod designed to attach to the top body flange of either the M38 or M38Al truck. The salient features of the T152E5 mount are shown

in Fig. 2. The T152E4 mount at Aberdeen Proving Ground will be made into a T152E5 assembly by replacing the legs and lower housing with corresponding T152E5 parts.

A special feature of the T152E4 and T152E5 mounts is the squeeze type trigger located on the handwheel knobs. Fig. 3 shows this trigger and also the safety lock on the firing mechanism.

Fig. 4 is an assembly of the T137E3 rifle and T152E5 mount.

Charge Development for 34-pound Projectile

Since the T137E3 rifle was designed to chamber M323 and M325 ammunition as well as T138 and T119 ammunition it would be convenient if rounds loaded for the M27 rifle could be safely fired from the T137E3 rifle. A charge development program was conducted at Erie Ordnance Depot to see if this is possible. PA-30240 propellent and 34-pound M2Al howitzer slugs were used to establish the pressure which would be developed in the T137E3 rifle with the regular M323 type charge. The data for this charge development are given in Table II and Fig. 5.

The pressure required for a muzzle velocity of 1120 ft/sec is 12,300 lb/sq in (cu). This exceeds the maximum rated pressure of the rifle (11,000 lb/sq in). The M323 round for the M27 rifle contains approximately 8 lb of M10, .035in web powder. An extrapolation of the data in Fig. 5 shows that a pressure of 13,700 lb/sq in would result for an 8-lb charge of PA-30240 propellent. Although the web of PA-30240 propellent is smaller (.033 in) than that used with the M323 round (for the M27 rifle) it appears clear that it would not be safe to fire a regular M27 round in the Tl37E3 rifle. It is proposed to load the M323 and M325 rounds for the T137E3 rifle with PA-E-6119 (.038in web) or with the duplex loading being developed by Frankford Arsenal.

Table II
Charge Development Data
34-pound Slug

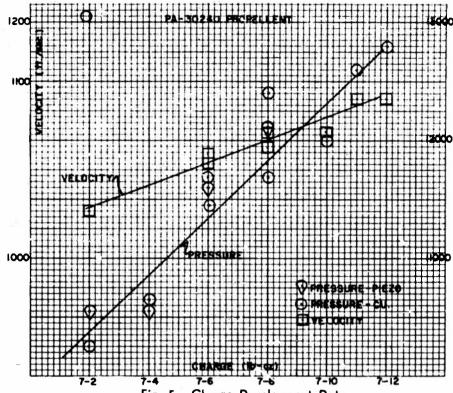

Fig. 5. Charge Development Data. 34-pound Projectile.

Piezo-Copper Pressure Measurement

It is well known that the relation between copper pressure and piezo pressure depends on the particular rifle and propellent used. Table III and Fig. 6 show data obtained with the Tl37E2 rifle using PA-30240 propellent. Over the range

10,000 lb/sq in to 13,000 lb/sq in, it is seen that the comparison between M3 copper gauges and external piezo gauges is essentially one to one. Since both 17.5-lb slugs and 34-lb slugs were used it appears that over this range the projectile weight does not affect the copperpiezo relationship.

Table III
Copper-Piezo Pressure Relations

Projectile Weight(lb)	Piezo Pressure (Ib/sq in)	Copper Pressure (lb/sqin)
17.5	7,382	7,350
17.5	10,810	10,400
17.5	11,601	12,250

34	12,133	12,400
34	10,734	11,150
Note: Copper pre	ssures are avera	ges of two M-3 gages

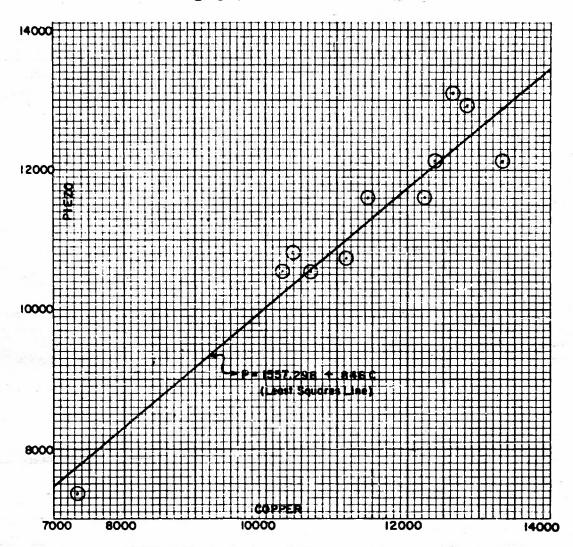

Fig. 6. Copper-Piezo Relationship.

Cartridge Case

It was stated in the Twenty-fifth Progress Report that the M32 cartridge case, with minor modifications, was used in the Tl37F3 rifle. It was found necessary to heat treat the M32 case to prevent bulging. Several tests were performed with the objective of making the heat treatment unnecessary. The data for these tests are given in Table IV. Modifications A, B, C, D were attempts to obtain more rapid ignition at the base of the shell case. Modification B gives a slight improvement in case bulging but does not

permit a 115% pressure round to be fired without bulging the case. Other modifications did not give significant improvement. Therefore the heat treatment of the M32 shell case is still necessary.

Although the use of the T-88 primer, which has only 300 grains of A-1 black powder, does not reduce case bulging, ignition at 70°F seems as satisfactory as with the 1000 grain M57 primer. Low temperature tests will be conducted with this primer to see whether it is satisfactory at -40°F.

Table IV M32 Cartridge Case Tests Sulging Tests

Case Type	Charge (lb oz)	Pressure (Ib/sqin)	Ignition	Remarks

11 11 11	7-13 1/2	11,400	M57 Mod. C	slight bulge
11 11 11	7-13 1/2		M57 Mod. D	11 11
11 11 11	7-13 1/2		T88	no bulge
11 11 11	8-9	13,800	T88	slight bulge

Modifications:

- A. $3 \frac{1}{2}$ " sleeve on tip of primer.
- B. Twelve holes at tip of primer covered, no pressure gages, base of polyethylene liner removed.
- C. Twelve additional holes at base of primer.
- D. Doughnut of 100 grains A-l black powder 3" from base of primer.
- * PA-E-6084 propellent. All other rounds used PA-30239.

Future Program

- 1. Two rifle systems will be shipped to Fort Benning, Georgia for Field Forces evaluation. A third weapon system will be shipped to Aberdeen Proving Ground for engineering tests.
- 2. Continue design study of a light weight, wheeled mount.
- 3. Establish an experimental pressure-travel curve.

- 4. Evaluate four lots of special double base propellents for temperature coefficient.
- 5. Evaluate the T-88 primer for low temperature ignition.

T138 PROJECTILE

Performance of T138E57 Projectiles at 2000 Yards

Two programs in which T138E57 projectiles were fired at a 2000-yard range at Erie Ordnance Depot were reported in the Twenty-Third Progress Report.

A third program to test the accuracy of the T138E57 projectile at a 2000-yard range was fired at Aberdeen Proving Ground. Twenty rounds were fired at a 20 ft by 20 ft target. Four rounds were spent in getting on the target and ten of the next sixteen rounds hit the target. The probable errors for the hits were V.P.E.=.74 mil and H.P.E.=.65 mil. Observers reported good flight for four rounds that missed the target and slight precession in four other rounds. The firing record for this test is found in Table V and Fig. 7 is a plot of the target.

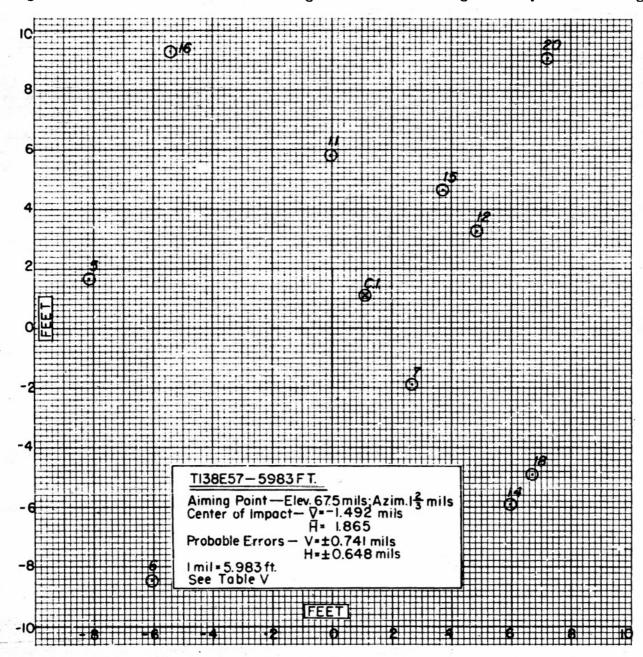

Fig. 7. Dispersion Chart.
T138E57 Projectile, 2000 Yerds, 1-200 Tube.

Because of the good performance of the T138E57 at ranges of less than 2000 yards it was thought desirable to determine whether the accuracy of the T138E57 at longer ranges (above 1500 yards) could be improved by launching at a higher spin rate. Therefore, a fourth accuracy program at 2000 yards was undertaken.

Nineteen rounds of T138E57 projectiles were fired at Erie Ordnance Depot from a modified T19 rifle with a 1-120 tube. One round hit a velocity coil and fourteen of the remaining eighteen rounds hit the target. The probable errors for the hits are V.P.E.=.54 mil and H.P.E.=.46 mil.

The target size was 20 ft by 20 ft. None of the misses were observed to have poor flight characteristics. Table VI is a copy of the firing record and Fig. 8 is a plot of the hits on the target.

When fired at 45 rev/sec (1-120 tube) twelve of the fourteen hits had no measurable yaw; at 25 rev/sec (1-200 tube) only two of ten had angles of yaw of less than 8 degrees and two had yaw angles of 25 degrees.

Table VII summarizes the data for the performance of the T138E57 projectiles at 2000 yard range.

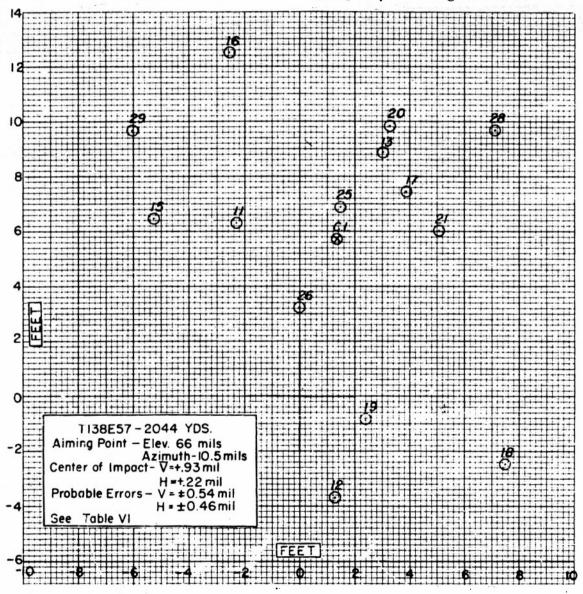

Fig. 8. Dispersion Chart

Future Program

l. A group of inert rounds are being prepared for a comparison accuracy firing program to be fired at Aberdeen Proving Ground. Projectiles will be fired for accuracy at ranges of 1500 and 2000 yards using tubes having 1-200 and 1-120 twists under as nearly identical conditions as

possible.

2. A group of HEAT rounds using special liners will be fired for penetration at Aberdeen Proving Ground from a tube having a 1-120 twist.

T119 PROJECTILE

Accuracy Programs - T119 Projectile

During the past month, Tl19E8 projectiles were fired for accuracy at ranges of 1000 and 2000 yards.

Accuracy at 2000 Yards

The 2000-yard program, fired at Aberdeen Proving Ground, was intended to provide a check on accuracy data previously obtained at Erie Ordnance Depot. A total of 25 rounds of TllSE8 projectiles, including 6 rounds for gun conditioning and "laying on" the target, were fired. Nineteen hits were obtained on the 20 ft. by 20 ft. target. The probable errors of dispersion were V.P.E. = . 50 mil and H.P.E.=.34 mil. A T137E2 gun with a 105-in., smooth bore tube was used for this program. Table VIII is a chart showing the details of the Tl19E8 projectile and Table IX is a copy of the range data.

The results of this test are in agreement with earlier tests at 2000 yards and confirm that the Tll9 projectile has good accuracy for at least 2000 yards.

Accuracy From a Rifled Tube

To determine the accuracy of the T119 E8 projectile when launched without obturation from a tube rifled 1-20, twenty T119E8 projectiles were fired at Erie Ordnance Depot at a range of 1000 yards. A modified T19 rifle was used because an appropriately rifled tube was not immediately available for the T137 rifle.

The rounds were fired in two groups. One group of twelve Tll9E8 rounds was fired in the morning. Eleven rounds hit the target; the twelfth struck a velocity screen and missed the target. An additional group of eight Tll9E8 rounds was fired in the afternoon. The second

round fired went over the target, and the aiming point for the remaining rounds was changed. Separate centers of impact were calculated for each group of hits, and the two centers of impact were superimposed for the calculation of the dispersion. The probable errors of the dispersion for the eighteen hits were V.P.E.=.44 mil and H.P.E.=.47 mil. The firing data are contained in Table X.

The shift in the center of impact is attributed to a tightening of the gun tube in the chamber when the gun conditioning slugs were fired. It was noted that the torque from rotation of the banded slugs caused the tube to turn approximately one inch on its circumference relative to the chamber. Total gun elevations were established with a gunner's quadrant-positioned on a flat on the chamber. In a later program with another projectile, it was established that the T19 rifle had a large forward recoil and it is felt that this may have contributed to the dispersion.

These results demonstrate that the T119 projectile can be fired, without obturation, from a tube rifled 1-20. The accuracy is within the .5 mil requirement for the BAT weapon.

Charge Development

A charge development program was fired at Aberdeen Proving Ground. A charge of 8 lb. 4 oz. of MOMP propellent.

.038-in. web, lot number PA-E-6119, was found to produce a velocity of 1700 ft/sec when the Tl19E8 projectile, assembled with the T53El shell case and M57 primer, was fired from the Tl37E3 rifle. On the basis of this charge development, Picatinny Arsenal has been instructed to load Tl19E8 rounds with 8 lb. 4 oz. of PA-E-6119 propellent.

T119E8 Projectile for Engineering and Service Board Tests

Type	Date Shipped To Picatinny	Quantity
	10 Picatinny

HEAT	9-13-52	35
HEAT	9-19-52	50

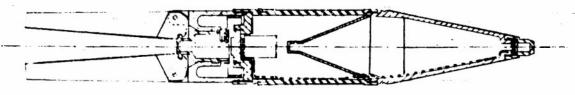

An additional 15 each of inert and HEAT T119E8 projectiles are being assembled and will be shipped to Picatinny Arsenal for loading during October. This ship-

ment will complete the entire quantity of T119E8 projectiles which were manufactured.

Future Program

A lot of 2500 Tll9Ell projectiles is being made. A chart showing details of the Tll9Ell projectile modification is given in Table XI. It is believed that shipments of these projectiles will start in October, 1952 and that a rate of at least 100 per week can be reached shortly thereafter.

NOTE: All components of Tll9Ell are identical with those of Tll9El0 with the exception of the body. The obturating band groove has been eliminated from the new body to permit firing of the Tll9Ell projectile from rifled tubes.

PENETRATION STUDIES

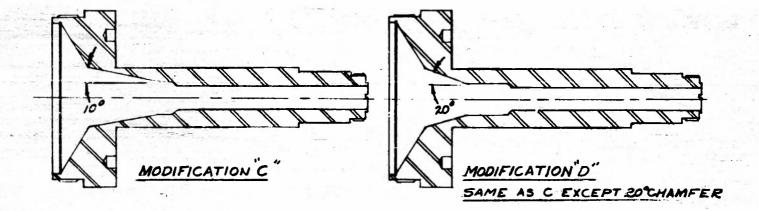

Effect of Internal Tee Configuration

The reduction in penetration resulting from the use of a DRC314 tee with a non-rotated DRB398 cone was described in the Twenty-Fourth Progress Report. Tests reported in the Twenty-Fifth Progress Report showed that the major portion of the interference is in the boom and/or boom entry hole. These tests have been continued.

Four series of rounds with various tees, totaling twelve rounds, have been tested. Figure 9 shows the various tee modifications. Cone inspection data are shown in Table XII and penetration data are given in Table XIII.

The average penetration for the three

rounds with unmodified tees is 16.83 inches, 4.0 inches less than the penetration of the controls without tees. The average penetration for the rounds having modifications C and D are 17.75 and 17.89 inches, respectively, indicating that about one inch of penetration may be gained by enlarging the boom entry hole slightly. Modification E, complete removal of the boom, permitted an average ponetration of 19.00 inches, 2.2 inches better than the unmodified tee but 1.8 inches poorer than a standard nose ring. Thus, of the four inch reduction in penetration arising as a result of jet interference in the DRC 314 tee, approximately 50% (2 inches) is lost in the boom, and 50% (2 inches) is lost in the entry hole to the boom. About 25% (1 inch) may be recovered by enlarging the boom entry hole slightly.

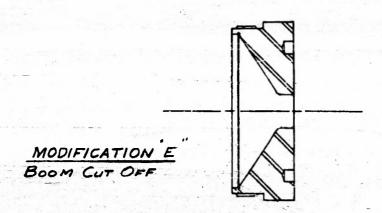

Fig. 9. Various Tee Modifications.

Q650	11	2.60	17.75		
Q655		2,60	16.62		
			Avg. 17.89	2.69	±1.35
Q374	Mod. E	2.60	19.69		
Q645		2.62	18,88	1	54 E
Q649	11	2.60	18.44		
			Avg. 19.00	1.25	±.63
C	ontrols (DRC3	76 Assemblies	Avg. 20.80	1.00	±.48

Notes:

- 1. DRC376 bodies and base plugs, tees as indicated.
- 2. Loaded at Ravenna Arsenal, BAT Lot #17, Comp B from Holston Lot 3-126.
- 3. All rounds fired at 0 rev/sec and 7.5 inches standoff.

Future Program

- 1. Conduct penetration versus standoff tests for 45° and 20° copper cones (100-inch wail) with head of H.E. held constant at 3.63 in.
- 2. Evaluate the influence of DRC 314 tees made of (a) mild steel (b) high ductility malleable iron, and (c) low ductility malleable iron.
- 3. Continue tests to determine the effect of interior tee configuration upon

O

penetration.

- 4. Continue scaling studies with smaller liners.
- 5. Composite cones. The penetration behavior of steel and of aluminum cones each with thin copper inserts, and of copper cones with thin aluminum inserts, is being compared with homogeneous copper cones. Initial tests will be at 0 and 25 rev/sec.

FUZES

T223E2 Superquick-Delay Mechnaical Fuze

Nine rounds containing T223E2 fuzes (Fig. 11, Twenty-Fifth Report) were fired at Erie Ordance Depot. Six, loaded with spotting charges, were fired against a 3 1/2-in. wooden bursting screen. Three, set for superquick functioning, were observed to function on the screen. Two of three others, set for delay functioning, were observed to function after passing through the 3 1/2-in. wooden bursting screen.

The three remaining rounds were fired into the recovery box to study the functioning of the delay element. All three were recovered and inspection showed that the delay elements in each had functioned properly.

T222E3 (DRA 496-2) Nose Element Crystai Assemblies

Test slugs weighing fifteen pounds have been fired from a 75mm gun at T138 E57 tee assemblies containing T223E3 crystal assemblies. In each case a BS28 indicator and an oscilloscope were connected in parallel across the crystal.

Attempts to photograph the voltagetime trace were continued but in these tests the film was presensitized according to the directions in the Dumont 297 Camera Manual. A one megohm potentiometer was placed across the vertical plates of the oscilloscope to obtain a greater attenuation than is available using the internal control.

Four projectiles were fired in this test but only two hit the tees squarely enough to close the foil switch (of the two rounds that failed to close the switch,

O

one hit the rim of the tee cap and the other hit the shoulder of the tee). The BS 28 indicator functioned on all four rounds. The voltage-time trace for round four was successfully photographed and showed that a peak of 800 volts was produced.

A subsequent firing of seven projectiles produced two additional hits. Readable pictures were obtained for both of these rounds. The maximum voltage for one round was 900 volts. This voltage fell to 100 volts in .56 microseconds.

The maximum voltage for the second round was 650 volts, which fell to 150 volts in 1.5 microseconds. The voltage rise time was too short for accurate determination. Additional tests are planned.

Base Elements (DRD328) for T222E5 Fuze

Six T138E57 projectiles containing DRD328 base elements (Fig. 10 of Twenty-Fifth Progress Report) and T222E3 nose elements (DRA496-2) were fired. Each round contained a tetryl pellet and sufficient spotting charge to make possible an observation of functioning. Five rounds were fired at 4-in. wooden bursting screens; two at 75 ft (the maximum arming distance permissible under contract DA-33-019-ORD33); two at 100 ft and one at 200 ft. None of the fuzes functioned. Therefore, the remaining round was fired for recovery. Subsequent examination of the recovered round disclosed that it was unarmed. The setback pins had failed to release the rotor. The inner surface of the holes for the setback pins was quite rough. Furthermore, the number two pin was found to have a too small bearing surface at one end, permitting the pin to tilt and bind. Further tests are planned.

Future Program

l. Fire a confirmatory test group of 10 T223E2 fuzes, set for delay, before incorporating such fuzes in live loaded HE rounds.

(8)

(6

O

O

2. Continue the experiments to determine the power generated by the "lucky"

elements.

3. Repeat the arming distance experiments on T222E5 base elements using longer arming pins and with an improved finish on the holes.
